

IN THE CLAIMS:

1. (Currently Amended) A securable enclosure, the securable enclosure having a front opening, said securable enclosure comprising:

a top panel;

first and second side panels;

a rear panel,

the top panel, first and second side panels, and rear panel being connected to each other with the securable enclosure in an assembled state to bound a storage space accessible through the front opening;

a first connector part fixedly attached to one of the top panel, first side panel, second side panel, and rear panel;

a second connector part fixedly attached to another one of the top panel, first side panel, second side panel, and rear panel,

the first and second connector parts releasably connected, each to the other, without requiring any additional separate parts to maintain the one and the another of the top panel, first side panel, second side panel, and rear panel together with the securable enclosure in the assembled state,

wherein the first and second connector parts are connectable and releasable from each other by accessing and repositioning at least one of the first and second connector parts from within the storage space by repositioning at least a part of the at least one of the first and second connector parts relative to the one or the another of the top panel, first side panel, second side panel, and rear panel to which the at least one of the first and

second connector parts is fixedly attached, with the securable enclosure in the assembled state,

wherein the one and the another of the top panel, first side panel, second side panel, and rear panel are fixed together so that the one and the another of the top panel, first side panel, second side panel and rear panel are angled with respect to each other to define an inside corner and an outside corner, and the first and second connector parts are mounted at the inside corner so as to be accessible only through the front opening with the securable enclosure in an assembled state; and

a lockable closure element which is movable between open and closed positions,

wherein the one of the top panel, first side panel, second side panel, and rear panel has a substantially flat first surface and a first flange with a flat surface that is angularly disposed to the first surface,

wherein the another of the top panel, first side panel, second side panel and rear panel has a substantially flat second surface and a second flange with a flat surface that is angularly disposed to the second surface,

wherein with the securable enclosure in the assembled state, the flat surface on the first flange is facially abutted to the flat surface on the second flange,

wherein at least one of the first and second connector parts extends fully through the first flange to connect to the other of the first and second connector parts,

wherein the first and second flanges each have an opening therethrough to accommodate the first and second connector parts and at least one of the first and second

connector parts is spaced from the flange on the panel on which the at least one of the first and second connector parts is located.

2. (previously amended) The securable enclosure according to claim 1 wherein the first connector part comprises a clip body and the second connector part comprises a repositionable lock hook that is releasably connectable to the clip body, the another of the top panel, first side panel, second side panel, and rear panel having a substantially flat surface to which the second connector part is mounted, the flat surface residing in a reference plane, the repositionable lock hook is pivotably attached to a housing and the housing is pivotable relative to the another of the top panel, first side panel, second side panel, and rear panel about an axis that is substantially parallel to the reference plane between a) a first position wherein the repositionable lock hook can be connected to the clip body and b) a second position wherein the repositionable lock hook is urged so as to biasably urge the one and the another of the top panel, first side panel, second side panel, and rear panel against each other.

3. (previously amended) The securable enclosure according to claim 2 wherein the lock hook is accessible for movement thereof only from within the storage space with the securable enclosure in the assembled state.

4. (previously amended) The securable enclosure according to claim 1 wherein the top panel is releasably connected to each of the first and second side panels and rear panel through at least first and second pairs of releasable cooperating connector parts with

the connector parts in the first pair of cooperating connector parts provided one each on a) the top panel and b) one of the first side panel, second side panel, and rear panel, the connector parts in the second pair of cooperating connector parts provided one each on c) the top panel and another one of the first side panel, second side panel, and rear panel, the connector parts on the at least first and second pairs of releasable cooperating connector parts being connected, each to the other, without requiring any additional separate parts or repositioning of the panels to which the first and second pairs of releasable connector parts are connected.

5. (previously amended) The securable enclosure according to claim 1 wherein the securable enclosure further comprises a front frame panel for a closure element and the front frame panel is releasably connected to at least one of the top panel, first side panel, and second side panel through at least first and second pairs of releasable cooperating connector parts the connector parts in the first pair of cooperating connector parts provided one each on a) the front frame panel and b) one of the top panel, first side panel, and second side panel, the connector parts in the second pair of cooperating connector parts provided one each on c) the front panel and another one of the top panel, first side panel, and second side panel, the connector parts in the at least first and second pairs of releasable cooperating connector parts being connected, each to the other, without requiring any additional separate parts or repositioning of the panels to which the first and second pairs of releasable connector parts are connected.

Claims 6-7. (cancelled)

8. (previously amended) The securable enclosure according to claim 1 further comprising a bottom panel which is releasably connected to at least one of the first side panel, second side panel, and rear panel.

9. (previously amended) The securable enclosure according to claim 8 wherein the bottom panel is releasably connected to the at least one of the first side panel, second side panel, and rear panel through releasable cooperating connector parts with one of the cooperating connector parts being attached to the bottom panel and another of the connector parts being attached to the at least one of the first side panel, second side panel, and rear panel.

10. (previously amended) The securable enclosure according to claim 1 wherein the securable enclosure further comprises a bottom panel and a reinforcing rod that extends between the top panel and the bottom panel, the reinforcing rod being spaced from each of the first and second side panels and the rear panel.

11. (cancelled)

12. (currently amended) The securable enclosure according to claim ~~[[11]]~~ 1 wherein the first surface is substantially orthogonal to the second surface.

13. (currently amended) The securable enclosure according to claim ~~[[11]]~~ 1 wherein the first and second connector parts biasably draw the flat surfaces on the first and second flanges against each other.

14. (cancelled)

15. (previously amended) The securable enclosure according to claim 1 wherein the first and second connector parts are releasably, biasably held connected to each other.

16. (previously amended) The securable enclosure according to claim 1 wherein the first and second connector parts define a connector assembly, wherein the securable enclosure comprises a plurality of connector assemblies including at least one connector assembly that acts between each of a) the top panel and at least one of the first side panel, second side panel, and rear panel, b) the first side panel and at least one of the top panel and the rear panel, c) the second side panel and at least one of the top panel and the rear panel, and d) the rear panel and at least one of the top panel, the first side panel, and the second side panel.

17. (previously amended) The securable enclosure according to claim 16 wherein the plurality of connector assemblies maintain the top panel, first and second side panels, and rear panel together with the securable enclosure in the assembled state without requiring any separate fasteners or repositioning of the panels to which the first and second pairs of releasable connector parts are connected.

18. (previously amended) The securable enclosure according to claim 1 wherein a first of the top panel, first side panel, second side panel, and rear panel has a locating post thereon, and another of the top panel, first side panel, second side panel, and rear panel has a locating slot thereon which receives the locating post with the securable enclosure in the assembled state.

19. (previously amended) The securable enclosure according to claim 18 wherein the locating post is fixed on the first panel.

20. (previously amended) The securable enclosure according to claim 19 wherein the locating post comprises a neck with an enlarged head on the neck, the enlarged head is moved into the locating slot by moving the first panel in a first direction in a first line with the first and another panels in a first relative position, and the slot is configured so that with the enlarged head moved through the slot, shifting of the first panel relative to the another panel transverse to the first line to a second relative position causes the enlarged head to act against the another panel to thereby block movement of the enlarged head out of the slot by movement of the first panel parallel to the first line oppositely to the first direction.

21. (previously amended) The securable enclosure according to claim 20 further comprising a third connector part on the first panel and a fourth connector part on the another panel, the third and fourth connector parts being releasably connectable, each to the other to maintain the first and another panels in the second relative position.

Claims 22-35. (cancelled)
